

Financial Statements Analytics Dashboard

An interactive Power BI solution that benchmarks a sector's companies on one screen, built from live SEC filings.

Overview

What it is: An interactive dashboard that turns published financial statements into a like-for-like peer comparison across a sector.

Coverage: Payments sector: Visa, Mastercard, PayPal, fiscal years 2021–2025. The model scales to more companies and sectors.

Data source: SEC EDGAR XBRL API (company facts), pulled by company CIK. Refreshes on a schedule, no manual entry.

Tools: Power BI Desktop, Power Query (M), DAX, SEC API.

Repository: [Click here to view the Power BI file, full report PDF, and documentation on GitHub](#)

Business Objective

Pick a sector and a company, and see who grows fastest, who turns revenue into profit and cash most efficiently, who carries more leverage, and how each has moved over five years. Every figure ties back to the 10-K, so the view is decision-grade, not directional. It replaces the manual work of pulling filings and rebuilding spreadsheets with a single screen.

Data Pipeline and Architecture

The dashboard reads each company's filings straight from the SEC API by CIK, maps the XBRL tags to statement lines, and loads a star schema: a long Fact_Financials table with Dim_Company (company, ticker, sector) and Dim_Date. Adding a company is one CIK. Adding a sector is one row.

It also handles the messiness of real filings. Companies tag the same line differently, Visa reports revenue under one XBRL tag, Mastercard and PayPal under another. The measures resolve the correct tag per company, so totals stay right as the company set grows.

Pages

1. Executive Summary

Purpose: One-screen read on which company leads on the metrics that matter: size, profitability, returns and cash.

What's on it: KPI cards (revenue, net income, net margin, return on equity, free cash flow), five-year revenue and net-margin trends, and a peer comparison table.

Decision it supports: Which company to look at first, and where the clear standouts and laggards are.

Insight: Across FY2021–2025 Visa holds the highest net margin (about 55%) and PayPal the lowest (about 13%), and the gap stays wide, so the profitability ranking is stable rather than converging

2. Income Statement

Purpose: How each company turns revenue into operating and net income.

What's on it: Revenue, operating income and net income by company, an operating-margin trend, and a reconciling P&L matrix.

Decision it supports: Who runs the most efficient cost structure, and whether margins are improving or slipping.

Insight: Visa and Mastercard convert roughly 55–66% of revenue into operating income; PayPal converts about 17%, so it earns far less per revenue dollar despite a comparable top line.

3. Balance Sheet

Purpose: Capital structure, liquidity and leverage across the peers.

What's on it: Assets, liabilities and equity by company, a current-ratio trend, and a balance sheet that ties out each year.

Decision it supports: Who carries balance-sheet risk, and whose short-term liquidity is tightening.

Insight: Visa's current ratio fell from about 1.75 to 1.08 over five years as current liabilities rose; all three stay near or above 1.0, so coverage is adequate but trending down for Visa.

4. Cash Flow

Purpose: Cash generation and how much of it is genuinely free.

What's on it: Operating vs free cash flow, capital expenditure, and free-cash-flow conversion by company.

Decision it supports: Who funds growth and buybacks from real cash rather than accounting profit.

Insight: All three are capital-light, with capex only a few percent of revenue; Mastercard converts more than 100% of net income into free cash flow, the strongest of the three.

5. Ratio and Peer Comparison

Purpose: Rank the peers on every key ratio at once.

What's on it: Returns by company, a net-margin trend, and a full ratio matrix with the leading company highlighted per metric.

Decision it supports: An at-a-glance ranking for an investment, lending or benchmarking call.

Insight: Mastercard posts the highest return on equity, well above 100%, lifted by buybacks that shrink its equity base; Visa leads on margin and PayPal trails on both.

6. Company Deep-Dive

Purpose: One company's full three-statement history in isolation.

What's on it: Single-company KPI cards, P&L and cash flow over time, and a year-by-year detail table, driven by a single-select company filter.

Decision it supports: Whether one company's trend is strengthening or weakening before acting on it.

Insight: Selecting Mastercard shows steady revenue growth with free cash flow rising year over year, and a return on equity pushed higher by continued share buybacks.

Intelligence It Provides

A like-for-like comparison across a sector in one view: growth, margins, returns on equity and assets, liquidity, leverage, cash conversion, and the five-year trend on each. Because every number reconciles to the filing, the comparison is decision-grade rather than indicative.

Decisions It Supports

- Where to invest or lend rank the companies on returns, margin and cash generation.
- Who is the stronger operator, and whether that gap is widening or closing.
- Balance-sheet risk: who is leveraging up, and whose liquidity is tightening.
- Client benchmarking: measure one company against its peers to find over- or under-performance worth acting on.

Scaling and Production

Published to the Power BI Service with a scheduled refresh against the SEC API, the dashboard updates itself each quarter. A new company is one CIK; a new sector is one row in Dim_Company. Work that used to mean downloading filings and rebuilding spreadsheets becomes a page that refreshes on its own. That is time saved and fewer places for a manual error to enter.

Data Accuracy and Governance

- Sourced from SEC filings through the company-facts API, so the figures are the filed numbers by construction.
- Every balance sheet balances (assets = liabilities + equity), and cash flow ties (free cash flow = operating cash flow minus capex).
- FY2023 and FY2024 figures for all three companies were cross-checked against each company's 10-K.

Skills Demonstrated

API data integration, Power Query transformation, star-schema data modeling, DAX (per-company tag resolution, time intelligence, ratio and returns measures), multi-company and multi-sector design, data-accuracy discipline, and financial-statement analysis.

Note

Built entirely from public SEC filings (EDGAR). All figures are reported GAAP; no confidential data is used. Portfolio demonstration.
